Class 10 Mathematics Chapter 9 – Notes and Extra Questions

$\tan \theta = h/d$ , where  $\theta$  is the angle of elevation from the observer to the top of the object.

Reference figure — angle of elevation, height and distance

## Class 10 Maths Chapter 9 – Some Applications of Trigonometry: NCERT Solutions

Chapter 9 of Class 10 Maths applies the trigonometric ratios learned in Chapter 8 to real-life problems of heights and distances. In the current 2026-27 rationalised syllabus, this chapter has a single exercise, **Exercise 9.1**, with 16 questions. Every solution below is worked from first principles using the standard trigonometric ratio values.

### Why this chapter matters for boards

Height-and-distance problems are a guaranteed 3-5 mark question in every CBSE Class 10 Maths board paper. They test whether a student can correctly translate a word problem into a right triangle, identify the angle of elevation/depression, and apply the correct trig ratio. Diagrams and clean step-by-step working earn method marks even if the final answer has a small arithmetic slip.

### Key idea before you start

Angle of elevation is measured upward from the horizontal to the line of sight; angle of depression is measured downward. In every problem here, draw the right triangle first, mark the known side and angle, then choose tan, sin, or cos based on which two sides are involved.

### Exercise 9.1 Solutions

**Q1.** A circus artist climbs a 20 m rope tied from the top of a vertical pole to the ground, making a  $30^\circ$  angle with the ground. Find the height of the pole.

Height =  $20 \times \sin 30^\circ = 20 \times \frac{1}{2} = 10 \text{ m.}$

**Q2.** A tree breaks in a storm; the broken top touches the ground 8 m from the foot, making a  $30^\circ$  angle with the ground. Find the height of the tree.

Standing part  $h = 8 \tan 30^\circ = \frac{8}{\sqrt{3}} \text{ m}$ . Broken part  $l = \frac{8}{\cos 30^\circ} = \frac{16}{\sqrt{3}} \text{ m}$ . Total height =  $\frac{8}{\sqrt{3}} + \frac{16}{\sqrt{3}} =$

$\frac{24}{\sqrt{3}} = 8\sqrt{3} \text{ m (approx 13.86 m).}$

**Q3.** Two slides: one 1.5 m high at  $30^\circ$ , one 3 m high at  $60^\circ$ . Find each slide length.

Slide 1: length =  $1.5 / \sin 30^\circ = 3 \text{ m}$ . Slide 2: length =  $3 / \sin 60^\circ = \frac{6}{\sqrt{3}} = 2\sqrt{3} \text{ m}$ .

**Q4.** A point on the ground is 30 m from a tower's foot; angle of elevation of the top is  $30^\circ$ . Find the tower's height.

Height =  $30 \tan 30^\circ = \frac{30}{\sqrt{3}} = 10\sqrt{3} \text{ m.}$

**Q5.** A kite flies at 60 m height; the string makes a  $60^\circ$  angle with the ground. Find the string length.

Length =  $60/\sin 60^\circ = 120/\sqrt{3} = 40\sqrt{3}$  m.

**Q6.** A 1.5 m boy watches a 30 m building; elevation increases from  $30^\circ$  to  $60^\circ$  as he walks closer. Find the distance walked.

Height above eye level = 28.5 m.  $d_1 = 28.5/\tan 30^\circ = 28.5\sqrt{3}$ .  $d_2 = 28.5/\tan 60^\circ = 28.5/\sqrt{3}$ . Distance walked =  $28.5\sqrt{3} - 28.5/\sqrt{3} = 19\sqrt{3}$  m (approx 32.9 m).

**Q7.** From a point on the ground, angles of elevation of the bottom and top of a 20 m tall transmission tower fixed atop a building are  $45^\circ$  and  $60^\circ$ . Find the tower's (aerial's) height.

Distance from point d =  $20/\tan 45^\circ = 20$  m.  $\tan 60^\circ = (20+h)/20 \Rightarrow 20\sqrt{3} = 20+h \Rightarrow h = 20(\sqrt{3} - 1)$  m

(approx 14.64 m).

**Q8.** A 1.6 m statue stands on a pedestal; elevation of statue-top is  $60^\circ$ , of pedestal-top is  $45^\circ$ , from the same point. Find pedestal height.

Let pedestal height h, distance d = h (since  $\tan 45^\circ = 1$ ).  $\tan 60^\circ = (h+1.6)/h \Rightarrow \sqrt{3}h = h+1.6 \Rightarrow h(\sqrt{3}-1) = 1.6$

$\Rightarrow h = 0.8(\sqrt{3}+1)$  m (approx 2.18 m).

**Q9.** Elevation of a building's top from a tower's foot is  $30^\circ$ ; elevation of the 50 m tower's top from the building's foot is  $60^\circ$ . Find the building's height.  
 Distance  $d = 50/\tan 60^\circ = 50/\sqrt{3}$ . Building height  $= d \tan 30^\circ = (50/\sqrt{3})(1/\sqrt{3}) = \mathbf{50/3 \text{ m}}$  (approx 16.67 m).

**Q10.** Two equal poles stand on either side of an 80 m wide road; from a point between them, elevations are  $60^\circ$  and  $30^\circ$ . Find pole height and distances from each pole.

Let distances  $x$  and  $80-x$ .  $x\sqrt{3} = (80-x)/\sqrt{3} \Rightarrow 3x = 80-x \Rightarrow x = 20$ . Height =  $\mathbf{20\sqrt{3} \text{ m}}$ ; distances  $\mathbf{20 \text{ m}}$  and  $\mathbf{60 \text{ m}}$

**Q11.** From one bank of a canal, elevation of a TV tower on the other bank is  $60^\circ$ ; 20 m further back, elevation is  $30^\circ$ . Find the tower height and canal width.

Width  $d$ :  $d\sqrt{3} = (d+20)/\sqrt{3} \Rightarrow 3d = d+20 \Rightarrow d = 10$ . Width =  $\mathbf{10 \text{ m}}$ , height =  $\mathbf{10\sqrt{3} \text{ m}}$ .

**Q12.** From atop a 7 m building, elevation of a cable tower's top is  $60^\circ$  and depression of its foot is  $45^\circ$ . Find the tower's height.

Horizontal distance  $d = 7/\tan 45^\circ = 7$  m. Height above building level  $= 7 \tan 60^\circ = 7\sqrt{3}$ . Total tower height =

**$7(1+\sqrt{3})$  m** (approx 19.12 m).

**Q13.** From a 75 m lighthouse, angles of depression of two ships (in line, same side) are  $30^\circ$  and  $45^\circ$ . Find the distance between them.

$d_1$  ( $45^\circ$ ) = 75 m.  $d_2$  ( $30^\circ$ ) =  $75\sqrt{3}$  m. Distance =  **$75(\sqrt{3}-1)$  m** (approx 54.9 m).

**Q14.** A 1.2 m girl watches a balloon at 88.2 m height; elevation reduces from  $60^\circ$  to  $30^\circ$ . Find the distance travelled by the balloon.

Height above eye = 87 m.  $d_1 = 87/\sqrt{3} = 29\sqrt{3}$ .  $d_2 = 87\sqrt{3}$ . Distance  $= 87\sqrt{3} - 29\sqrt{3} = \mathbf{58\sqrt{3} \text{ m}}$  (approx 100.4 m).

**Q15.** From a tower, a car's angle of depression changes from  $30^\circ$  to  $60^\circ$  in 6 seconds as it approaches. Find the further time to reach the tower's foot.

Let height  $h$ .  $d_1 = h/\sqrt{3}$ ,  $d_2 = h/\sqrt{3}$ . Distance covered in 6s  $= 2h/\sqrt{3}$ , speed  $= h/(3\sqrt{3})$  per second. Remaining distance  $d_2 = h/\sqrt{3}$ , time  $= d_2/\text{speed} = \mathbf{3 \text{ seconds}}$ .

**Q16.** From two points 4 m and 9 m from a tower's base (same line), the elevations are complementary. Prove the tower's height is 6 m.

$\tan \theta = h/4$  and  $\tan(90-\theta) = h/9$ , so  $\tan \theta \times \cot \theta = 1 = h^2/36$ , giving  $h^2 = 36$ ,  $h = \mathbf{6 \text{ m}}$ . Proved.

## CBSE Exam Weightage

This chapter falls under **Unit V: Trigonometry** in the CBSE Class 10 Maths board exam syllabus. This unit typically carries around **12 marks (15%)** of the 80-mark theory paper, based on CBSE's published unit-wise weightage (Question Paper Design). CBSE sets weightage at the unit level rather than chapter-by-chapter, so the exact share from this specific chapter can vary a little between years and sample papers.

## Class 10 Mathematics Chapter 9 – Notes and Extra Questions

Along with these NCERT Solutions, students can also use the [Class 10 Mathematics Chapter 9 Extra Questions](#) and [Class 10 Mathematics Chapter 9 Revision Notes](#) for quick revision and extra practice.
